919-480-3997 | adeyefaife@gmail.com | github.com/iadeyefa

EDUCATION

Duke University

Master of Science in Computer Science

- Incoming Graduate Student: Fall 2026

Durham, NC

Expected May 2028

University of Florida

Bachelor of Science in Computer Science

- GPA: 3.83, Dean's List
- Relevant Coursework: Deep Learning, Data Science, Natural Language Processing, Data Structures & Algorithms, Databases, Operating Systems

Gainesville, FL

Expected May 2026

TECHNICAL SKILLS

Languages: Java, Python, TypeScript, SQL, C#

Frameworks and Tools: Spring Boot, React, Flask, Django, scikit-learn, Pandas, NumPy, OpenAI API, Git

Systems and Data: Docker, Linux, CI/CD, PostgreSQL, Prometheus, Grafana, Unity

EXPERIENCE

Software Engineer Intern

First Citizens Bank

May 2025 – August 2025

Raleigh, NC

- Designed and deployed a production-grade Spring Boot backend and RESTful APIs with PostgreSQL to automate internal QA workflows.
- Implemented centralized observability using Prometheus and Grafana, transforming Splunk log data into structured metrics and instrumenting 5 distributed services to enable real-time debugging and reduce incident triage time.

Software Engineer Intern

Comet

July 2022 – September 2022

Remote

- Developed and optimized reusable React components for a college-planning platform, increasing scheduling conversions by streamlining booking flows
- Collaborated with cross-functional teams to translate feature requirements into scalable UI architecture based on structured user feedback.

PROJECTS

PitchEye - Multi-View Soccer Capture System | *Python, React, PostgreSQL, WebRTC, FFmpeg*

- Built a multi-view soccer capture platform with React, Django, React Native, and Supabase, enabling teams to organize sessions, generate QR-based access, and collect sideline footage from multiple smartphones into one shared workspace.
- Implemented a live video pipeline for match coverage using RTMP ingest, HLS playback, and FFmpeg-based stream archiving, supporting mobile streaming from the field and browser-based viewing across camera angles.
- Designed team-scoped collaboration features including role-based session creation, session join flows, clip uploads, player tagging, and comments to support coaches and players reviewing match footage together.

Intelligent Traffic Management Simulator | *Unity, C#, OpenStreetMap, ArcGIS CityEngine*

- Built an automated data pipeline to reconstruct real-world road networks as Bézier-based lane graphs for multi-agent traffic simulations.
- Engineered an adaptive traffic signal controller that increased vehicle throughput by 300% (up to 9,000 vehicles/min) while reducing wait times to under 12s.

AI-Driven Sports Highlight Ranking System (RLHF-Inspired) | *Python, OpenCV, scikit-learn, FastAPI*

- Engineered a video/audio feature extraction pipeline using OpenCV and librosa, capturing motion intensity, crowd noise, and shot transitions to feed a pairwise ranking model trained on user preference feedback.
- Designed a FastAPI preference collection interface enabling iterative RLHF-style model updates, evaluated with pairwise accuracy and precision@k, achieving measurable improvement over the rule-based baseline across successive feedback rounds.
- Deployed a top-k highlight selection endpoint for processing short-form sports clips, with ranking quality improving iteratively as the model accumulated pairwise preference data.
